Excerpt: . . . point except P there passes one other integral curve, and it is tangent to T; while an infinite number of integral curves may pass through P no one of which is tangent to T. Or T may be a cusp locus, so that through every point except P there passes one integral curve, and it has a cusp at this point; while an infinite number of integral curves may pass through P no one of which has a cusp at P. In this case it may happen also that for any point except P the integral curve is not tangent to T, while at P every one of an infinite number is tangent to P. 6. Klein has considered the problem of determining the two parameters of the differential equation of La in 6 in such a manner that the equation furnishes two solutions, one of which vanishes at the end points of a second interval Oji, and oscillates m times within the interval, and the other vanishes at the end points of a second interval aj0 and oscillates n times in the interval, m and n being positive integers or zero arbitrarily prescribed. Other special problems of a special nature which involve two or more parameters have been treated by Klein and Bocher. For the case of two parameters these may be considered as special cases of the following: If p. () 0, qi (. c) 0, At. (x), (i 1, 2;j 1,...
